Microwave-assisted synthesis of 3-aminobenzo[b]thiophene scaffolds for the preparation of kinase inhibitors†

Mark C. Bagley,†a Jessica E. Dwyer,a Maria D. Beltran Molina,b Alexander W. Rand,a Hayley L. Randa and Nicholas C. O. Tomkinsonb

Microwave irradiation of 2-halobenzonitriles and methyl thioglycolate in the presence of triethylamine in DMSO at 130 °C provides rapid access to 3-aminobenzo[b]thiophenes in 58–96% yield. This transformation has been applied in the synthesis of the thieno[2,3-b]pyridine core motif of LIMK1 inhibitors, the benzo[4,5]thieno[3,2-e][1,4]diazepin-5(2H)-one scaffold of MK2 inhibitors and a benzo[4,5]thieno[3,2-d]-pyrimidin-4-one inhibitor of the PIM kinases.

Introduction

Benzothiophenes are naturally-occurring heterocycles, found in petroleum deposits in their simplest form but also discovered recently as a motif in more complex glycosides isolated from the roots of E. grijissi.1 Benzothiophenes are important components of organic semiconductors due to their potential for elongated and highly delocalised electronic structures.2,3 Substituted benzothiophenes have also found application in drug discovery as highly-privileged structures and valuable building blocks in medicinal chemistry, being incorporated into tubulin polymerisation inhibitors,4,5 acetyl-CoA carboxylase inhibitors,6 antidepressants,7 and as estrogen receptor modulators.8,9 Benzothiophenes are present in a number of clinical agents, including Raloxifene,10 a selective estrogen receptor modulator, Zileuton,11 an inhibitor of 5-lipoxygenase and leukotriene biosynthesis used for the treatment of asthma, and the antifungal agent Sertaconazole, which inhibits the synthesis of ergosterol.12

Scaffolds based upon 2- or 3-aminobenzo[b]thiophenes have enormous potential for further derivatization and have shown great promise in fragment-based drug discovery and in hit identification or lead development, including approaches towards antimitotic agents5,13 and in the development of inhibitors of kinase targets, such as the LIMK protein family,14 PIM-kinases15 and MAPK-2 kinase (MK2) (Fig. 1).16,17 A number of 3-aminothieno[2,3-b]pyridine-2-carboxamide hits, such as 1, were identified from high throughput screening (HTS) as inhibitors of LIMK1, leading to the development of tricyclic derivatives such as 2a and the benzothieno[3,2-d]pyri-
midine 2b as a LIMK1 inhibitor lead candidate, to disrupt actin polymerisation and thus prevent the metastatic potential of tumour cells where LIMK is over-expressed.

Benzothienopyrimidinones have been investigated as PIM kinase inhibitors.\textsuperscript{15} The PIM kinases (PIM1, PIM2 and PIM3) have been implicated in tumourigenesis and simultaneous targeting of all three isoforms has presented itself as a promising approach in cancer therapy, with PIM triple knockout mice found to be viable and fertile.\textsuperscript{16} The benzothiophene scaffold was again identified from an initial HTS hit,\textsuperscript{15} leading to the development of a range of potent and selective benzo[\textit{b}]thiophene-derived inhibitors such as 3 with nM activity ($K_i$ values of 2, 3 and 0.5 nM against PIM1, PIM2 and PIM3, respectively) with oral bioavailability in mouse models.

Examples of aminobenzothiophene derivatives are also found amongst inhibitors of the mitogen activated protein kinase (MAPK) family of enzymes. These enzymes are essential for inflammatory cell signalling events and contain historically popular drug targets for inflammatory diseases, including rheumatoid arthritis and Crohn’s disease because of their involvement in the production of pro-inflammatory cytokines,\textsuperscript{19} as well as being implicated in accelerated cellular ageing in Werner syndrome (WS) via p38.\textsuperscript{20–23} MAPK-activated protein kinase (MK2) is a rate-limiting kinase downstream of p38 in the MAPK pathway and has been the subject of many studies in recent years,\textsuperscript{24} as MK2 knock-out mice possess normal healthy phenotypes whereas p38 knock-out mice are lethal.\textsuperscript{25} The aminobenzo[\textit{b}]thiophene derivative PF-3644022 shows excellent kinase selectivity for MK2, in vivo potency on a nanomolar scale and projected ADME characteristics that suggested it was suitable for oral human dosing.\textsuperscript{17,26,27} However, PF-3644022 was found to result in hepatotoxicity in dogs\textsuperscript{27} and so the analogue PF029 was developed and exhibited an improved toxicological profile with no loss of cellular potency. This was rationalized through installation of a metabolic shunt onto the reactive diazepinone ring and extension of the biaryl ring section to increase the compound’s cationic character, thus reducing its molecular affinity for transporter proteins.

As part of our interest in the synthesis of MAPK inhibitors for the study of cellular ageing in Werner syndrome,\textsuperscript{20,28–33} the benzothiophene scaffold, and its selectivity and cellular activity profile for MK2 exemplified by PF-3644022, made it an attractive target for synthesis. We have shown that treating young WS cell cultures with p38 MAPK inhibitors can bring about a complete reversal of the ageing phenotype, giving increased replicative life-span, growth rates comparable to normal young cells and a reduction in levels of F-actin stress fibres.\textsuperscript{20,23} These findings suggested that WS could be amenable to therapeutic intervention, but with high toxicity and poor kinase selectivity exhibited in vivo by many p38 inhibitors,\textsuperscript{34–36} an inhibitor scaffold that targeted the downstream kinase MK2 would offer a promising alternative target.\textsuperscript{20,37}

With such a range of biological properties, there is a continuing interest in the search for new methods to access substituted benzothiophenes.\textsuperscript{38} One approach, with the potential to incorporate diversity into a target library, would be to employ transition metal-mediated processes from the corresponding 3-halobenzo[\textit{b}]thiophenes.\textsuperscript{39} However, methods for the synthesis of 3-halobenzo[\textit{b}]thiophenes are currently fairly limited. In particular, routes can be problematic when using ring halogenation due to the low reactivity of the heteroaryl unit and its functional group compatibility.\textsuperscript{40–43} The 5-endo-dig halocyclisation of ortho-alkynylation thiophenol derivatives offers an alternative approach,\textsuperscript{44–48} but this requires installation of an alkyne by metal-catalyzed cross-coupling followed by cyclisation, mediated by a halogen-containing electrophile, so can exhibit a number of inherent disadvantages.

Herein, we present an annulation-based method for the rapid preparation of 3-halo and 3-amino-2-substituted benzo[\textit{b}]thiophenes suitable for elaboration to a range of kinase inhibitors.\textsuperscript{49} It employs microwave irradiation as a convenient platform for fast reaction kinetics, and to improve reaction efficiency, and avoids the need for metal-catalyzed processes to establish the parent heterocycle. This method is shown to be suitable to access the pharmacophore of a range of biologically-active scaffolds for application in medicinal chemistry and drug discovery.

### Results and discussion

The benzothiophene-containing chemotypes appearing in recent drug discovery programmes (Fig. 1) feature, or could in principle be derived from, electron-poor aminobenzothiophene intermediates or their 7-aza analogues (Scheme 1). For
example, the PIM kinase inhibitor scaffold 4 has been accessed from 5-bromobenzothiophene 5a, using the halogen as a handle for library diversification in a late-stage Suzuki coupling.15 Similarly, it could be hypothesized that inhibitors of MK2 for study in WS cells, such as PF-3644022 (Fig. 1), could be prepared from the same core motif 5, using 5-nitrobenzothiophene 5b, rather than by the functionalization of 6-nitroquinoline as reported by Anderson et al.17 This approach would enable the synthesis of a range of diverse chemical tools from a single common template. The original route to MK2 hit compound 6a, prior to the development of PF-3644022,16 employed cinnamic acid 6a in reaction with thionyl chloride in chlorobenzene at 120 °C to establish the 6-nitroquinoline as reported by Anderson et al. Hence an alternative route had to be sought.

Our first approach towards scaffold 6b used an alternative and established method to access 3-halobenzothiophenes by halogenation of the corresponding benzothiophene. The condensation of methyl thioglycolate with 2-chloro-5-nitrobenzaldehyde 9 under basic conditions gave methyl 5-nitrobenzo[\(b\)]thiophene-2-carboxylate (10) in high yield (Scheme 2). We have shown in previous work how microwave dielectric heating can be used to dramatically reduce reaction times in the synthesis of inhibitor scaffolds.60 Given that elevated temperature has promoted this,53,54 and a closely-related process for the synthesis of 2-acetylbenzothiophenes,55 we carried out this transformation under microwave irradiation at 90 °C to give the benzothiophene 10 in good yield, whilst shortening the reaction time from 17 h to 15 min. Selective halogenation at C-3 of 10 was facilitated in a convoluted sequence of reactions via the carboxylic acid 11 to overcome poor heterocycle reactivity.40 Saponification, again conducted by microwave dielectric heating, under basic conditions was complete in 3 min at 100 °C and gave the carboxylic acid 11 in excellent yield. Subsequent heating with excess bromine and sodium acetate in glacial acetic acid did give 3-bromobenzothiophene 13 in good yield after esterification using methyl iodide on a number of occasions. However, the bromination was found to be highly variable and efforts to develop an alternative process using microwave heating were constantly frustrated56 and so a more reliable and efficient route was sought. The poor yield of this bromination reaction is catalogued in a recent report.57

In an alternative approach, our success in the microwave-assisted synthesis of 10 was adapted to incorporate an amino group at C-3, amenable by diazotization chemistry to provide efficient access to 3-bromobenzothiophene 13. The cyclocondensation of methyl thioglycolate with 2-nitrobenzonitriles under basic conditions has been established by Beck,58–60 and adapted methods with halide displacement have also been reported.51–64 By switching the base from NaOMe61 to Et3N63 and heating either 5-bromo-2-fluorobenzonitrile (14a) or 2-fluoro-5-nitrobenzonitrile (14b) and methyl thioglycolate gave the corresponding 3-aminothiophene 5a,b in very high yield (Scheme 3), e.g. for 5b either at 100 °C in DMSO for 2 h using conductive heating (95% yield) or under microwave irradiation at 130 °C for 11 min (94% yield), after simply pouring the reaction mixture into ice-water and collecting the product by filtration. Subsequent deaminative bromination60 of aminobenzo[\(b\)]thiophene 5b using tert-butyl nitrite in acetonitrile in the presence of copper(II) bromide gave the target bromobenzothiophene 13 in excellent yield by this much more direct route.

The scope of this method was further explored by investigating a number of substrates (Scheme 4, Table 1), suitable for...
elaboration to a range of benzothiophene-containing scaffolds found in drug discovery (Fig. 1).

It was found that the process was highly efficient for highly electron-poor precursors, such as 14a-d (entries 1–4), and was generally more effective with 2-fluorides, but could also accommodate bromides and iodides albeit with reduced efficiency (Table 1, entries 8 and 9). In most cases a very simple work up procedure was effective, providing benzothiophenes 5a–h in 65–96% yield in reaction times varying between 11 and 35 min, depending upon substrate. The efficiency compared well to other available methods (cf. Table 1, entry 7, with Beck synthesis of 5g, 52% yield after 20 h), and so this method was adopted as the route of choice to access the benzothiophene scaffold. Furthermore, it was possible to apply the procedure to the synthesis of 7-azabenzothiophene 16 using 2-halonicotinonitriles 15a–c. Interestingly, the choice of halogen as substrate did not cause much variation in the yield of azabenzothiophene product 16 (entries 11–13), which represents the core heterocyclic motif of the 3-aminothieno[2,3-b]pyridine-2-carboxamide inhibitors

Finally, an application of our microwave-assisted method to access a pre-functionalized benzo[4,5]thieno[3,2-d]pyrimidin-4-one scaffold 21 as a chemical tool for PIM kinase inhibition was investigated. This inhibitor exhibits subnanomolar to single-digit nanomolar $K_i$ values against all three PIM kinases and has been co-crystallised with PIM1, guiding subsequent SAR studies. It was postulated that rather than introducing the cyclopropylvinyl group by a late-stage Suzuki coupling, in accordance with the original diversification study, this group could be incorporated from the start in order to access directly. To that end, 2-fluorobenzonitrile 14i was prepared by the Pd-catalyzed Suzuki–Miyaura coupling of 5-bromo-2-fluorobenzonitrile (14a) and the corresponding boronate ester at 80 °C, and heated with methyl thioglycolate in the presence

Characterization of title compound

The crude title compound was purified by column chromatography on silica gel (30–40 mesh) with 4:1 pentane:ethyl acetate as eluent to afford title compound as brown solid. The physical constants were measured as follows: mp, 1H NMR spectra were recorded in DMSO-d6 using Varian VNMR S spectrometer operating at 400 MHz or Bruker Avance II 400 MHz or Bruker Avance DRX 500 MHz for 1H spectra and 100 or 126 MHz for 13C spectra; J values were recorded in Hz and multiplicities were expressed by the usual conventions. Low resolution mass spectra were determined using a Waters Q-TOF Ultima equipped with a Waters electrospray positive ionization source, and a Thermo Quest Finnigan LCQ DUO electrospray, unless otherwise stated. Mass spectra were recorded in the range 400–600 m/z by using electron ionization at 70 eV (low resolution) or a ThermoQuest Finnigan LCQ DUO electrospray, unless otherwise stated. TOFMS refers to time-of-flight mass spectrometry, ES refers to electrospray ionization, CI refers to chemical ionization (ammonia), FTMS refers to Fourier transform mass spectrometry, NSI refers to nano-electrospray ionization and EI refers to electron ionization. A number of high resolution mass spectra were obtained courtesy of the EPSRC Mass Spectrometry Service at University College of Wales, Swansea, UK using the methods described.

Synthetic procedures

General procedure for synthesis of 3-aminobenzothiophenes

A mixture of the benzonitrile (1.0 equiv.), methyl thioglycolate (1.05 equiv.) and triethylamine (3.1 equiv.) in dry dMSO (2 M) was irradiated in a Biotage Initiator 2.5 EXP EU or CEM Discover microwave synthesizer at 130 °C for the time specified (hold time) by modulating the initial microwave power. After cooling to room temperature in a stream of compressed air, the reaction mixture was poured into ice-water and the resulting solid collected, washed with water and dried in vacuo to give the desired product.

Methyl 3-aminobenzothiophene-2-carboxylate

(5a). 5-Bromo-2-fluorobenzonitrile (14a) (0.50 g, 2.50 mmol), methyl thioglycolate (0.22 mL, 2.60 mmol) and triethylamine (1.10 mL, 7.75 mmol) were reacted according to the above general procedure for 11 min to give the title compound (700 mg, 96%) as a brown solid, mp 170–171 °C (Found [ES]–: 285.9535. C9H7BrNO8S [MH]+ requires 285.9532; IR (neat) νmax/cm–1 3477 (N–H), 3363 (N–H), 2954 (C–H), 2754 (C–H); 1H NMR (400 MHz, d6-DMSO) δ ppm 4.84 (1H, d, J = 1.9 Hz, 4-CH), 7.82 (1H, d, J = 8.6 Hz, 7-CH), 7.64 (1H, dd, J = 8.6, 1.9 Hz, 6-CH), 7.17 (2H, bs, NH2), 3.79 (3H, s, Me); 11C NMR (101 MHz, d6-DMSO) δ ppm 164.6 (C), 148.6 (C), 137.7 (C), 133.2 (C), 131.0 (C), 125.7 (CH), 125.2 (CH), 117.1 (CH), 96.1 (C), 51.4 (Me); m/z (ES) 286 [M+H]+, 100%).

Methyl 3-aminobenzothiophene-2-carboxylate

(5b). Methyl 3-aminobenzothiophene-2-carboxylate (5a) (0.71 g, 2.50 mmol), methyl thioglycolate (1.05 mL, 7.75 mmol) and triethylamine (1.10 mL, 7.75 mmol) were reacted according to the above general procedure for 11 min to give the title compound (700 mg, 96%) as a brown solid, mp 244–245 °C (acetone, lit.67 mp 244–245 °C; Found [FTMS]–: 253.0280. C9H7BrNO8S [MH]+ requires 253.0278; IR (neat) νmax/cm–1 3445 (N–H), 3342 (N–H), 1681 (C=O), 1572 (NO2), 1432 (C–C), 1328 (NO2), 1276 (C–O), 1093 (C–O); 1H NMR (500 MHz, d6-DMSO) δ ppm 9.24 (1H, d, J = 2 Hz, 4-CH), 8.29 (1H, d, J = 9, 2 Hz, 6-CH), 8.12 (1H, d, J = 9 Hz, 7-CH), 7.47 (2H, bs, NH2), 3.82 (3H, s, Me); 13C NMR (100 MHz, d6-DMSO) δ ppm 164.2 (C), 149.6 (C), 144.9 (C), 144.5 (C), 131.4 (C), 124.3 (CH), 122.0 (CH), 119.4 (CH), 96.8 (C), 51.4 (Me); m/z (El) 252 [M]+, 100%. Methyl 3-aminobenzothiophene-2-carboxylate (5c). 5-Cyclopropyl-2-fluorobenzonitrile (14c) (0.50 g, 3.2 mmol), methyl thioglycolate (0.30 mL, 3.36 mmol) and triethylamine (1.38 mL, 9.92 mmol) were reacted according to the above general procedure for 11 min to give the title compound (710 mg, 92%) as a colourless solid, mp 170–172 °C (Found [ES]–: 242.0039. C11H7Cl5INO8S [MH]+ requires 242.0037; IR (neat) νmax/cm–1 3477 (N–H), 3365 (N–H), 1681 (C=O), 1278...
(C=O); 1H NMR (500 MHz, d6-DMsol) δH/ppm 8.30 (1H, d, J = 2.1 Hz, 4-CH), 7.88 (1H, d, J = 8.6 Hz, 7-CH), 7.53 (1H, dd, J = 8.6, 2.1 Hz, 6-CH), 7.17 (2H, bs, NH2), 3.79 (3H, s, Me); 13C NMR (126 MHz, d6-DMsol) δC/ppm 164.6 (C), 148.7 (C), 139.6 (C), 138.0 (C), 136.2 (C), 132.2 (C), 129.1 (C), 128.4 (CH), 125.0 (CH), 122.7 (CH), 96.2 (C), 51.4 (Me); m/z (ES) 242 (M+1H+, 100%). 1H NMR spectroscopic analyses were in good agreement with literature data. 15

**Methyl 3-aminobenz[b]thiophene-2-carboxylate** (5d). 2-Fluoro-4-(trifluoromethyl)benzonitrile (0.50 g, 2.64 mmol), methyl thioglycolate (0.24 mL, 2.73 mmol) and triethylamine (1.14 mL, 8.20 mmol) were reacted according to the above general procedure for 20 min to give the title compound (510 mg, 67%) as a colourless solid, mp 228–231 °C [Found ES+: 275.0101. **Methyl 3-aminobenz[b]thiophene-2-carboxylate** (5f). 4-Fluoro-[1,1′-biphenyl]-3-carbonitrile (14f) (0.30 g, 1.52 mmol), methyl thioglycolate (0.14 mL, 1.59 mmol) and triethylamine (0.65 mL, 4.74 mmol) were reacted according to a modified general procedure for 15 min. After cooling in a stream of compressed air, EtOAc (25 mL) was added and the solution was washed sequentially with water (3 × 25 mL) and brine (3 × 25 mL), dried over MgSO4 and evaporated in vacuo. Purification by flash chromatography on silica gel, eluting with light petroleum–EtOAc (4:1), gave the title compound (380 mg, 85%) as a colourless solid, mp 96–97 °C [Found ES+: 284.0741. C16H14N2O2S [MH+] requires 284.0740; IR (neat) νmax/cm−1 3481 (N–H), 3338 (N–H), 2949 (C–H), 1658 (C=C=O); 1H NMR (400 MHz, d6-DMsol) δH/ppm 8.54 (1H, s, 4-CH), 7.91 (1H, d, J = 8.5 Hz, 7-CH), 7.84 (1H, d, J = 8.5 Hz, 6-CH), 7.77 (2H, d, J = 7.5 Hz, 2′,6′PhH), 7.51 (2H, app t, J = 7.5 Hz, 3′,5′-PhH), 7.39 (1H, t, J = 7.5 Hz, 4′-PhH), 7.26 (2H, bs, NH2), 3.80 (3H, s, Me); 13C NMR (101 MHz, d6-DMsol) δC/pppm 164.8 (C), 149.9 (C), 139.6 (C), 138.0 (C), 136.2 (C), 132.2 (C), 129.0 (CH), 127.5 (CH), 127.2 (CH), 126.7 (CH), 123.6 (CH), 121.0 (CH), 95.0 (C), 51.2 (Me); m/z (ES) 284 (M+1H+, 100%).
of compressed air, the reaction mixture was poured into water and the resulting solid filtered under reduced pressure, washed with water and dried in air to give the title compound (0.84 g, 88%) as an off-white solid, mp 216.8–218.5 °C (lit.,69 mp 213–215 °C), with identical spectroscopic properties.

5-Nitrobenzo[b]thiophene-2-carboxylic acid (11), using conductive heating. A solution of aqueous NaOH (1 M; 5 mL, 5 mmol) was added to a solution of methyl 5-nitrobenzo[b]thiophene-2-carboxylate (10) (0.40 g, 1.7 mmol) in MeOH (5.5 mL) and the mixture was heated at reflux for 3 h. After cooling to room temperature, the solution was acidified with 1 M HCl (aq.) and the resulting solid filtered under reduced pressure and dried in air to give the title compound (0.36 g, 95%) as an off-white powder, mp 241.4–242.7 °C (lit.,71 mp 239–241 °C) (Found [TOFMS]: 224.0020. C₉H₄NO₃S [MH] requires 224.0018; IR (neat) νmax/cm⁻¹ 2844 (br, O=H), 1670 (C=O), 1600 (C=C), 1511 (NO₂), 1344 (NO₂), 1313 (C=O); ¹H NMR (500 MHz, CD₂OD) δ/ppm 9.30 (1H, dd, J = 2 Hz, 10-CH), 8.22 (1H, dd, J = 9, 2 Hz, 8-CH), 8.05 (1H, d, J = 9 Hz, 7-CH), 8.02 (1H, m, 1-NH), 7.95 (1H, d, J = 3 Hz, 4-NH), 3.60 (1H, m, 3-CH), 3.39 (2H, m, 2-CH₂), 1.16 (3H, d, J = 7 Hz, Me); ¹³C NMR (125 MHz, CD₂OD) δ/ppm 164.2 (C=O), 154.3 (C), 144.2 (C), 141.8 (C), 132.9 (C), 123.8 (7-CH), 120.8 (8-CH), 118.6 (10-CH), 108.6 (C), 50.6 (2-CH₂), 47.6 (3-CH), 18.6 (Me); m/z (ES) 277 [M⁺], 87%, 262 (24), 234 (29), 206 (30).

Methyl 5-nitrobenzo[b]thiophene-2-carboxylate (10), prepared under ambient conditions. Methyl thioglycolate (0.48 mL, 5.4 mmol) and K₂CO₃ (0.89 g, 6.5 mmol) were added sequentially to a solution of 2-chloro-5-nitrobenzaldehyde (1.01 g, 5.4 mmol) in DMF (6.5 mL) and the mixture was stirred at room temperature for 17 h. The reaction was then quenched in ice-water and the resulting solid collected, washed with water and dried in vacuo to give the title compound (1.22 g, 95%) as an off-white solid, mp 213.3–217.6 °C (lit.,69 mp 213–215 °C) (Found [FTMS + p NIS]: 255.0435. C₁₅H₁₅N₂O₄S [M⁺] requires 255.0434; IR (neat) νmax/cm⁻¹ 3093 (C=H), 1708 (NO₂), 1552 (C=C), 1453 (C), 1322 (C), 129.7 (7-CH), 120.8 (8-CH), 118.6 (10-CH), 108.6 (C), 50.6 (2-CH₂), 47.6 (3-CH), 18.6 (Me); m/z (ES) 277 [M⁺], 87%, 262 (24), 234 (29), 206 (30).

Methyl 5-nitrobenzo[b]thiophene-2-carboxylate (10), using microwave-assisted conditions. A mixture of 2-chloro-5-nitrobenzaldehyde (0.75 g, 4.0 mmol), methyl thioglycolate (0.45 mL, 5 mmol) and NaOH (0.67 g, 4.8 mmol) in DMF (4.5 mL) was irradiated at 90 °C for 15 min (hold time) in a pressure-rated glass tube (35 mL) using a CEM Discover microwave synthesizer by moderating the initial power (100 W). After cooling in a flow of compressed air, the reaction mixture was poured into water and the resulting solid filtered under reduced pressure, washed with water and dried in air to give the title compound (0.16 g, 94%) as an off-white powder, mp 241.3–242.1 °C (lit.,71 mp 239–241 °C), with identical spectroscopic properties.

3-Bromo-5-nitrobenzo[b]thiophene-2-carboxylic acid (12). According to a modified literature procedure,72 bromine (1.4 mL, 27 mmol) was added portion-wise to a solution of 5-nitrobenzo[b]thiophene-2-carboxylic acid (11) (1.0 g, 4.5 mmol) and anhydrous sodium acetate (1.13 g, 13 mmol) in glacial acetic acid (28 mL) under N₂. A reflux condenser was fitted and the solution heated at 55 °C for 27 h. After cooling to room temperature, the solution was poured into ice-water and the resulting solid isolated by vacuum filtration and dried in air to give the title compound (1.02 g, 75%) as a yellow powder, mp 309.5–316.8 °C (lit.,40 mp 307–309 °C) (Found [TOF MS]: 301.9126. C₁₅H₁₅BrNO₂S [MH] requires 301.9123; IR (neat) νmax/cm⁻¹ 2961 (br, O=H), 1701 (C=O), 1600 (C=C), 1511 (NO₂), 1347 (NO₂), 1270 (C=O), 620 (C=Br); ¹H NMR (500 MHz, CD₂OD) δ/ppm 9.30 (1H, dd, J = 2 Hz, 4-CH), 8.39 (1H, d, J = 9 Hz, 7-CH), 8.21 (1H, d, J = 9 Hz, 8-CH); m/z (EI) 259 (M⁺[Br⁺]), 98%, 301 (M⁺[Br⁺]⁺, 96), 293 (17), 291 (13).

Methyl 3-bromo-5-nitrobenzo[b]thiophene-2-carboxylate (13), from acid 12. According to a modified literature pro-
iodomethane (0.46 mL, 7.4 mmol) was added to a solution of 3-bromo-5-nitrobenz[b]thiophene-2-carboxylic acid (12) (1.12 g, 3.7 mmol) and K₂CO₃ (1.28 g, 9.2 mmol) in DMF (15 mL). After stirring at room temperature for 3 h, the reaction mixture was quenched with saturated aqueous NH₄Cl solution, poured into excess water and filtered under reduced pressure. The collected solid was washed with water and dried in air to give the title compound (1.09 g, 93%) as an off-white powder, mp 211.5–212.5 °C (lit.,[10] mp 211–212 °C) (Found [TOF MS]: 315.9279. C₁₈H₁₇BrNO₅ [M⁺] requires 315.9279); IR (neat) ν/cm⁻¹ 3101 (C–H), 1691 (C=O), 1600 (C=O, 1514 (NO₂), 1347 (NO₂), 1089 (C–O), 1052 (C–Br); ¹H NMR (500 MHz, CDCl₃) δ/ppm 8.90 (1H, d, J = 2 Hz, 4-CH), 8.38 (1H, dd, J = 9, 2 Hz, 6-CH), 8.00 (1H, d, J = 9 Hz, 7-CH), 4.02 (3H, s, Me); ¹³C NMR (125 MHz, CDCl₃) δ/ppm 161.0 (C), 146.5 (5-C), 144.6 (C), 138.9 (C), 131.0 (3a-C), 123.8 (7-C), 122.2 (6-CH), 121.3 (4-CH), 115.6 (3-CH), 53.0 (Me); m/z (EI) 317 [M⁺/Br]⁻ (100%), 315 [M⁺Br]⁻ (94%), 286 (58), 284 (55).

Methyl 3-bromo-5-nitrobenz[b]thiophene-2-carboxylate (13), from 3-aminobenzothiophene 5b. Following the procedure of Iaroshenko et al.[60] CuBr₂ (0.94 g, 4.2 mmol) was added to a solution of tert-butyl nitrite (0.45 mL, 3.8 mmol) in dry MeCN (11 mL) at 0 °C under argon. Methyl 3-aminobenzothiophene-2-carboxylate (5b) (0.69 g, 2.7 mmol) was then added portion-wise and the solution kept at 0 °C until nitrogen evolution ceased. The reaction mixture was allowed to warm to room temperature, stirred for 2 h and then poured into dilute hydrochloric acid (10%; 25 mL). The aqueous mixture was extracted with EtOAc (3 × 30 mL) and the organic extracts were combined, dried (Na₂SO₄) and evaporated in vacuo to give the title compound (0.86 g, 99%) as an orange solid, mp 212.3–213.0 °C (acetone) (lit.[60] mp 211–212 °C), with identical spectroscopic and spectrometric properties.

(E)-5-(2-Cyclopropylvinyl)-2-fluorobenzonitrile (14b). To a solution containing 5-bromo-2-fluorobenzonitrile (14a) (3.0 g, 15.0 mmol), Pd(PPh₃)₄Cl₂ (1.0 g, 1.5 mmol) and trans-2-cyclopropylvinlyboronic acid pinacol ester (3.7 mL, 18 mmol) in DME/EtOH/H₂O (7 : 2 : 3) (50 mL) was added aqueous Na₂CO₃ solution (1 M; 27 mL). The resulting mixture was placed under an atmosphere of nitrogen and heated at 80 °C for 16 h after which time the reaction was cooled to room temperature and filtered through Celite. Purification by flash column chromatography on silica gel, eluting with light petroleum–EtOAc (9 : 1), gave the title compound (2.4 g, 86%) as a yellow oil (Found [ES⁺]: 188.0868. C₁₂H₁₂NF [M⁺] requires 188.0870); IR (neat) ν/cm⁻¹ 3007 (C–H), 2496 (CN), 1672 (C=C); ¹H NMR (400 MHz, CDCl₃) δ/ppm 7.53–7.46 (2H, m), 7.16–7.08 (1H, m), 6.39 (1H, d, J = 15.7 Hz), 5.71 (1H, dd, J = 15.7, 9.0 Hz), 1.65–1.53 (1H, m), 0.92–0.84 (2H, m), 0.59–0.52 (2H, m); ¹³C NMR (100 MHz, CDCl₃) δ/ppm 161.7 (d, J = 258.2 Hz), 137.9, 135.3 (d, J = 3.5 Hz), 131.8 (d, J = 7.9 Hz), 130.0, 124.2, 116.5 (d, J = 20.3 Hz), 101.5 (d, J = 15.7 Hz), 77.2, 14.7, 7.6; m/z (ES) 188 [M⁺/H⁺], 100%.

Methyl 3-aminothiophene-2-carboxylate (16). 2-Chloro-3-pyridinecarbonitrile (15b) (35 mg, 0.25 mmol), methyl thioglycolate (0.22 mL, 0.25 mmol) and triethylamine (0.10 mL, 0.72 mmol) were reacted according to the above general procedure for 15 min to give the title compound (36 mg, 69%) as a yellow solid, mp 191 °C (dec.) (lit.,[13] mp 194–196 °C) (Found [ES⁺]: 209.0380. C₁₀H₁₂N₂O₂S [M⁺] requires 209.0385); IR (neat) ν/cm⁻¹ 3147 (N–H), 3314, 3202, 2943, 1679 (C=O), 1291 (C–O), 1127 (C–O); ¹H NMR (500 MHz, d₆-DMSO) δ/ppm 8.68 (1H, dd, J = 4.6, 1.6 Hz, 6-CH), 8.54 (1H, dd, J = 8.1, 1.6 Hz, 4-CH), 7.46 (1H, dd, J = 8.1, 4.6 Hz, 5-CH), 7.30 (2H, bs, NH₂), 3.80 (3H, s, Me); ¹³C NMR (101 MHz, d₆-DMSO) δ/ppm 164.7 (C=O), 159.7 (7a-C), 150.7 (6-CH), 147.7 (3-C), 131.4 (4-CH), 125.5 (3a-C), 119.4 (5-CH), 93.2 (2-C), 51.4 (Me); m/z (EI) 208 (M⁺/H⁺, 100%), 177 (28), 176 (93), 148 (60). ¹H NMR spectroscopic analyses were in good agreement with literature data.[13]

tert-Butyl [(2R)-1-aminopropan-2-yl]carbamate (17). According to a modified literature procedure,[72] a solution of Boc-D-Ala-OH (0.5 g, 2.64 mmol) and HOBt·H₂O (0.41 g, 3.0 mmol) in CH₂Cl₂ (20 mL) was cooled to 0 °C and EDCI·HCl (0.58 g, 3.0 mmol) was added. The solution was allowed to warm to room temperature and stirred for 30 min. The solution was then cooled to 0 °C, aqueous NH₄OH (18.1 M; 0.6 mL) was added drop-wise and the mixture was stirred at room temperature for 30 min. Any solid residue was removed by filtration and the filtrate was washed sequentially with water (20 mL) and brine (2 × 20 mL), dried (MgSO₄) and evaporated in vacuo. Purification by flash column chromatography on SiO₂, gradient eluting with MeOH–CH₂Cl₂ (from 3–7% MeOH), gave Boc-D-Ala-NH₂ (0.5 g, 2.7 mmol) in dry THF (9 mL) under N₂ at 0 °C. The reaction mixture was allowed to warm to room temperature, stirred for 18 h, evaporated in vacuo and treated with MeOH (3 × 15 mL), stirring and evaporating in vacuo each time. Purification by ion exchange chromatography using an Isolute SPE SCX-2 flash column, eluting first with MeOH and then with a solution of NH₃ in MeOH (2 M), gave the title compound (0.39 g, 84%) as a colourless oil (R₀ 0.3 in MeOH–CH₂Cl₂ 1 : 9) (Found [ES⁺]: 175.1443. C₁₀H₁₀N₂O₂ [M⁺] requires 175.1441); [d]₀ 25 = −5.7 (c 1.1, MeOH); IR (neat) ν/cm⁻¹ 2973 (C–H), 1685 (C=O), 1521 (N=H), 1364 (CH₃ deformation), 1247 (C=O), 1165 (C=N), 1045 (C–O), 872 (N–H); ¹H NMR (500 MHz, CDCl₃) δ/ppm 4.78 (1H, m, NHBOC), 3.60 (1H, m, 2-CH₂), 2.70 (1H, m, 1-CH₂), 2.59 (1H, m, 1-CH₂F), 1.40 (9H, s, CMe₃), 1.08 (3H, d, J = 7 Hz, 3-Me); ¹³C NMR (125 MHz, CDCl₃) δ/ppm 155.7 (C), 79.1 (C), 48.6 (2-CH₂), 47.4 (4-CH₂), 28.4 (CMe₃), 18.5 (Me). ¹H NMR spectroscopic analyses were in good agreement with literature data.[75]
diated at 150 °C for 75 min (hold time) in a pressure-rated glass tube (10 mL) using a CEM Discover microwave synthesizer by moderating the initial power (200 W). After cooling in a flow of compressed air, the reaction mixture was partitioned between water (20 mL) and EtOAc (30 mL). The aqueous layer was further extracted with EtOAc (2 × 30 mL) and the organic extracts were combined, washed with brine (30 mL) and evaporated. Purification by flash column chromatography on SiO₂ (dry load), gradient eluting with light petroleum to Et₂O-light petroleum (1:1), gave the title compound (50 mg, 76%) as a red solid, mp 195 °C (dec.) [Found ES⁺]: 410.1378. C₁₆H₁₈N₂O₅S [MH] requires 410.1380; δ²H, J = 55.3 (c 0.1, MeOH); IR (neat) νmax/cm⁻¹ 3355 (N–H), 2954 (C–H), 1672 (C=O), 1588 (NO₂) 1508 (C–C), 1325 (NO₂), 1230 (C–O), 1060 (C=N); ¹H NMR (500 MHz, CDCl₃) δ 7.91 (1H, d, J = 15.8 Hz, 7-CH), 7.69 (1H, dd, J = 8.5, 1.5 Hz, 6-CH), 6.68 (1H, d, J = 15.8 Hz, CH), 6.01 (1H, dd, J = 15.8, 9.2 Hz, CH), 3.52 (2H, s, CH₂), 2.29 (6H, s, Me), 1.66–1.56 (1H, m, NH), 0.85–0.78 (2H, m, CH₂), 0.61–0.54 (2H, m, CH₂); ¹³C NMR (101 MHz, CDCl₃) δ 155.2 (C), 154.2 (C), 131.5 (3-C), 145.2 (C), 144.3 (C), 131.1 (3-C), 124.7 (7-CH), 121.6 (6-CH), 120.5 (4-CH), 99.5 (2-C), 77.6 (CMe₂), 51.7 (OMe), 50.5 (1'-Me), 46.2 (2'-CH), 28.1 (CMe₃), 18.3 (3'-Me); m/z (EI) 410 [MH⁺], 100%, 409 (M⁺, 70).

Methyl 3-[(1-amino-2-chloroethylidene)amino]-5-[(E)-2-cyclopropylvinyl]benzo[b]thiophene-2-carboxylate hydrochloride (19). Methyl (E)-3-amino-5-[(2-cyclopropylvinyl)benzo[b]thiophene-2-carboxylate (5) (200 mg, 0.73 mmol) was suspended in a solution of HCl in 1,4-dioxane (4 M; 3 mL) and chloroacetone (91 µL, 1.43 mmol) was added drop-wise. The reaction mixture was stirred at room temperature for 16 h and the suspension was filtered under reduced pressure, washed with light petroleum (60 mL) and dried in vacuo for 6 h to give the title compound (110 mg, 39%) as a colourless solid, mp 195-197 °C (dec.) [Found ES⁺]: 317.0512. C₁₆H₁₄Cl₂N₂OS [MH − MeOH] requires 317.0513; IR (neat) νmax/cm⁻¹ 3332 (br, N–H), 3001 (C=H), 2932 (C–H), 1678 (C=O), 1620 (C=C); ¹H NMR (400 MHz, CDCl₃) δ 7.87 (1H, d, J = 15.8 Hz, 7-CH), 7.07 (1H, dd, J = 8.6, 1.5 Hz, 6-CH), 6.65 (1H, d, J = 15.8 Hz, CH), 5.96 (1H, dd, J = 15.8, 9.1 Hz, CH), 4.73 (2H, s, CH₂), 3.94 (3H, s, Me), 1.65–1.55 (1H, m, CH), 0.87–0.79 (2H, m, CH₂), 0.59–0.48 (2H, m, CH₂); ¹³C NMR (101 MHz, CDCl₃) δ 166.3 (C), 162.4 (C), 138.9 (C), 138.3 (CH₂), 138.0 (C), 135.8 (C), 130.5 (C), 130.4 (C), 127.7 (CH₃), 127.3 (CH), 124.6 (CH), 119.6 (CH), 53.4 (Me), 40.1 (CH), 15.5 (CH), 7.8 (CH₂, CH₃); m/z (ES) 349 (M⁺Cl⁻H⁺, 100%).

(E)-8-(2-Cyclopropylvinyl)-2-[(dimethylamino)methyl]benzo-[4,5]thieno[3,2-d]pyrimidin-4(3H)-one (20). Compound 19 (70 mg, 0.18 mmol) was added to a solution of dimethylamine in ethanol (33%; 3 mL) and the reaction mixture was stirred at room temperature for 16 h. The solvent was evaporated in vacuo and the resulting colourless solid was dissolved in MeOH–CH₂Cl₂ (1:1; 5 mL) and loaded onto an SCX cartridge (1 g). The cartridge was flushed with MeOH (3 × 5 ml) and then eluted with a solution of NH₃ in MeOH (2 M; 8 mL) to give the title compound as a colourless solid (55 mg, 94%), mp 202–203 °C (dec.) [Found ES⁺]: 326.1324 C₁₆H₁₄N₆O₂S [MH] requires 326.1322; IR (neat) νmax/cm⁻¹ 2873 (br, C=H), 1672 (C=O), 1587 (C=C); ¹H NMR (400 MHz, d₆-DMSO) δ 12.11 (1H, bs, NH), 8.09 (1H, d, J = 15.8 Hz, CH), 8.03 (1H, d, J = 8.5 Hz, 7-CH), 7.69 (1H, dd, J = 8.5, 1.5 Hz, 6-CH), 6.68 (1H, d, J = 15.8 Hz, CH), 6.11 (1H, dd, J = 15.8, 9.2 Hz, CH), 3.52 (2H, s, CH₂), 2.29 (6H, s, Me), 1.66–1.56 (1H, m, NH), 0.85–0.78 (2H, m, CH₂), 0.61–0.54 (2H, m, CH₂); ¹³C NMR (101 MHz, d₆-DMSO) δ 153.2 ppm 158.5 (C), 157.2 (C), 152.7 (C), 138.3 (C), 136.2 (CH₂), 135.2 (CH), 134.6 (C), 126.5 (C), 126.2 (CH), 123.9 (CH₂), 122.0 (C), 119.7 (CH), 61.3 (CH₂), 45.1 (Me), 14.7 (CH), 7.2 (CH₂, CH₃); m/z (ES) 326 (MH⁺, 100%).

Conclusions

This method for the microwave-assisted synthesis of 3-amino[2,3-b]thiophenes is rapid, simple to carry out and generally high yielding. It has been applied in the synthesis of a range of functional benzothiophenes and their 7-aza analogues and constitutes a very efficient route to the corresponding 3-halo-benzothiophenes using diazonium chemistry. Applications of this process have been shown in the synthesis of the thieno[2,3-b]pyridine core motif of LIMK1 inhibitors using 2-halopyridine-3-carbonitriles, the benzo[4,5]thieno[3,2-e][1,4]diazepino[5,2f]-one scaffold of MK2 inhibitors with functionality suitable for subsequent modification using Buchwald–Hartwig chemistry, and a benzo[4,5]thieno[3,2-d][pyrimidin-4-one target as a chemical tool for inhibition of PIM kinases. In the case of inhibitors of MK2, the use of this approach has been shown to be superior to traditional bromination chemistry using the parent benzothiophene heterocycle. Given the speed, efficiency and reliability of these methods, and their ability to incorporate a wide range of functionality, these approaches are likely to find application in providing chemical tools, rapidly, reliably and efficiently, for advancing studies in chemical biology, as well as to access targets in medicinal chemistry.
