

# Overview of the Second Order Optical Nonlinearity in GaN Waveguide for Use in Devices for Applications in Optical Communication

Md Shakil Ahmed, Ivan Glesk

Department of Electronic & Electrical Engineering, University of Strathclyde

**Purpose:** How second order nonlinearity of GaN is used in the realization of advanced optical devices in telecommunication.

## Advantages of GaN:

- Supports all types of optical nonlinearity. Silicon does not have second order nonlinearity.
- GaN is CMOS compatible. Best option for both microelectronics and photonics.
- Shows ultrafast relaxation time in electro-absorption switching devices. ISB recovery time=150~400fs.
- GaN based lasers, switches, modulators, amplifiers, photodetectors are possible to materialize.
- Supports photonic integration with Silicon and Lithium Niobate Micro-resonators.
- GaN does not suffer photorefractive effects. GaN based optical frequency converters would not require heating during frequency conversion.

**CMOS Compatibility:** GaN needs to be CMOS compatible to function as both microelectronics and photonics in device development for ultrafast communication.

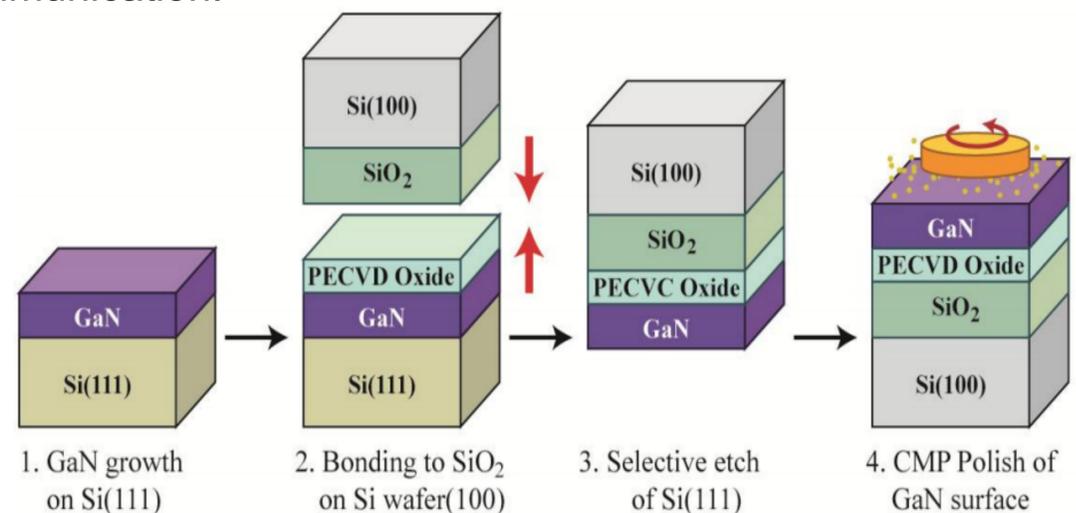

Fig 2. GaN on silicon dioxide on silicon substrate [2]

## Exploitation of Second Order Nonlinearity:

- Second order susceptibility can be achieved by breaking the symmetry of the conduction band potential.
- Large conduction band offset close to 1.8 eV in the interface of GaN/ AlN in telecommunication band.
- Utilizing ISBT and high relaxation time in QW, terahertz level optical switching is possible.
- QW shows remarkable spontaneous strained-induced piezoelectric polarization and breaks the symmetry and shows very high value of second order nonlinearity.

## Implementation of Second Order Nonlinearity:

- Modulators
- Resonators
- Bragg reflection Waveguide
- Optical Polarization based Logic Functions
- Parametric Optical Amplification
- Array Waveguide grating
- Quantum Optical Applications
- Quasi-phase matching

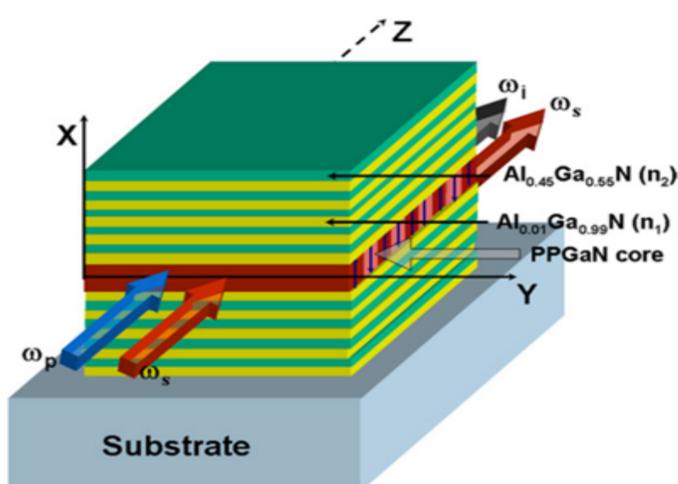

Fig 3. Diagram of Bragg Reflection Waveguide [3]

## Constraints:

- GaN is expensive compared to Silicon
- Lack of stable lattice-matched substrate
- Processing technology is not matured enough
