Jim Thomason - Background

University of Strathclyde

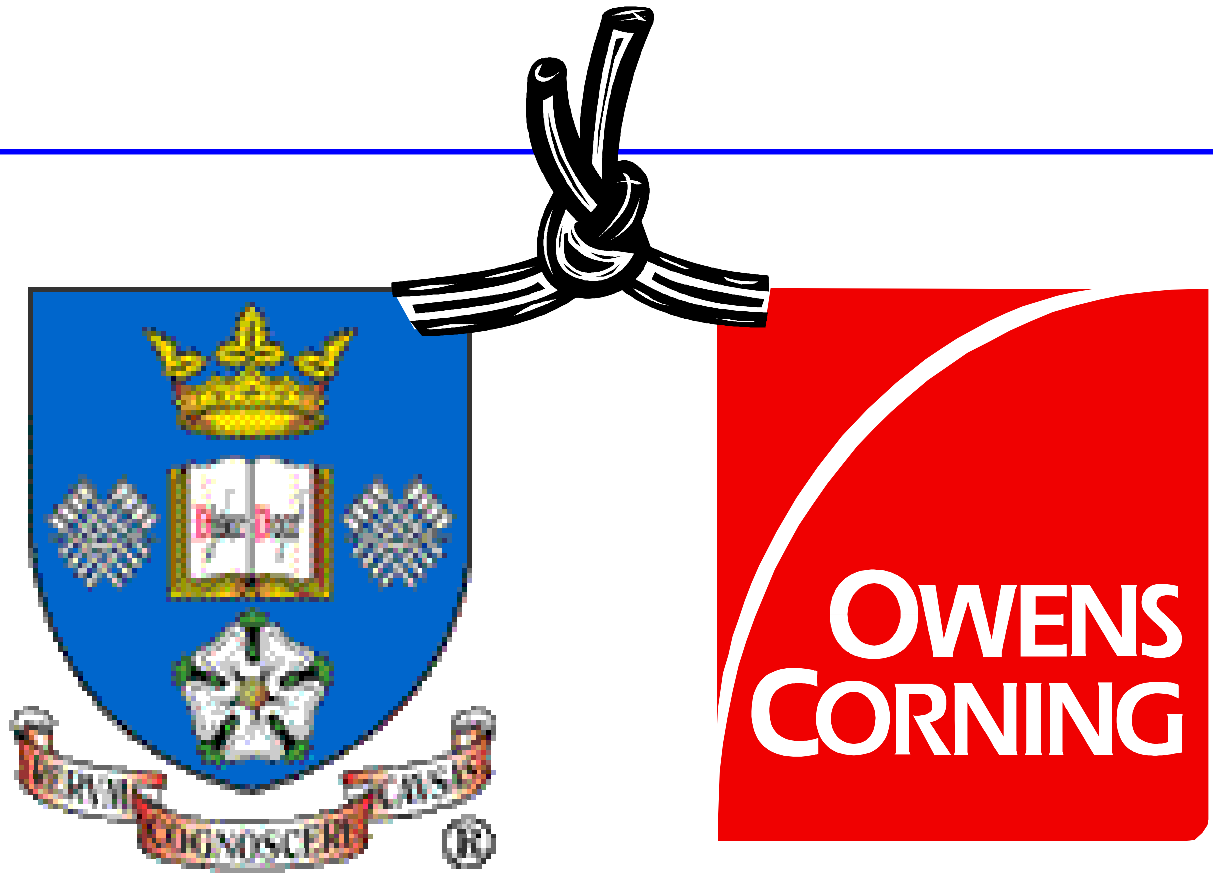
- **2007 - Professor of Advanced Materials & Composites, Univ. Strathclyde**
- **2003 - Visiting Professor, Univ. Sheffield, Dept. Eng Materials**
- **1996-2006 Owens Corning Science & Technology, USA & Belgium**
  - New Product development and fundamental research – composites & fibres.
  - Chair of 2004 Gordon Research Conference on Composites
- **1983-96 Shell Research, Amsterdam,**
  - Exploratory Research & Product Development –Polymers , Composites, Interfaces
- **1982-3 Mainz, Germany, Postdoc - polymer blends**
- **1981 Strathclyde PhD – Interphase in multiphase polymers.**
- **1977 Edinburgh BSc – Physics,**

Jim Thomason - Research Interests

University of Strathclyde

- Interfaces in High Performance Composites
- Natural fibre reinforced polymer composites
- Structure-Processing-Performance in Fibre Reinforced Thermoplastics
- Reinforcements - surface and microstructure
- Application of Molecular Modeling to Materials

University of Strathclyde



Making the University-Industry (Composite) Interface Work

Jim Thomason

Content

- Introduction
  - Does the materials industry support fundamental research ?
- Getting Support from Industry (an example)
- Results
  - Were we successful ?
- Conclusions -
  - What have we learned ?

Does the materials industry support fundamental research ?

University of Strathclyde

- It Depends
  - Which Company ?
  - Who are you talking with ?
- In General
  - Product cycle times are becoming shorter
  - Financial considerations are becoming more influential
- Therefore – fundamental research is becoming more difficult to justify within the current business climate

Does the materials industry support fundamental research ?

- However – at the same time
  - Customers demand more (productivity & performance)
  - Many (composite) products are high on the S-curve of the development cycle = less improvement for more effort
- One solution is to innovate more
  - Innovation by serendipity
  - New knowledge based Innovation
- Therefore – more fundamental insights are required

Product development & fundamental research

- Industry may support fundamental work which:
  - Reduces cost, time and waste to manufacture an existing product
  - Reduces cost and time to develop a new product
  - Improves quality
- Industry is less likely to support fundamental work which
  - Results in incremental performance improvements

Industrial Support for University Research Programmes

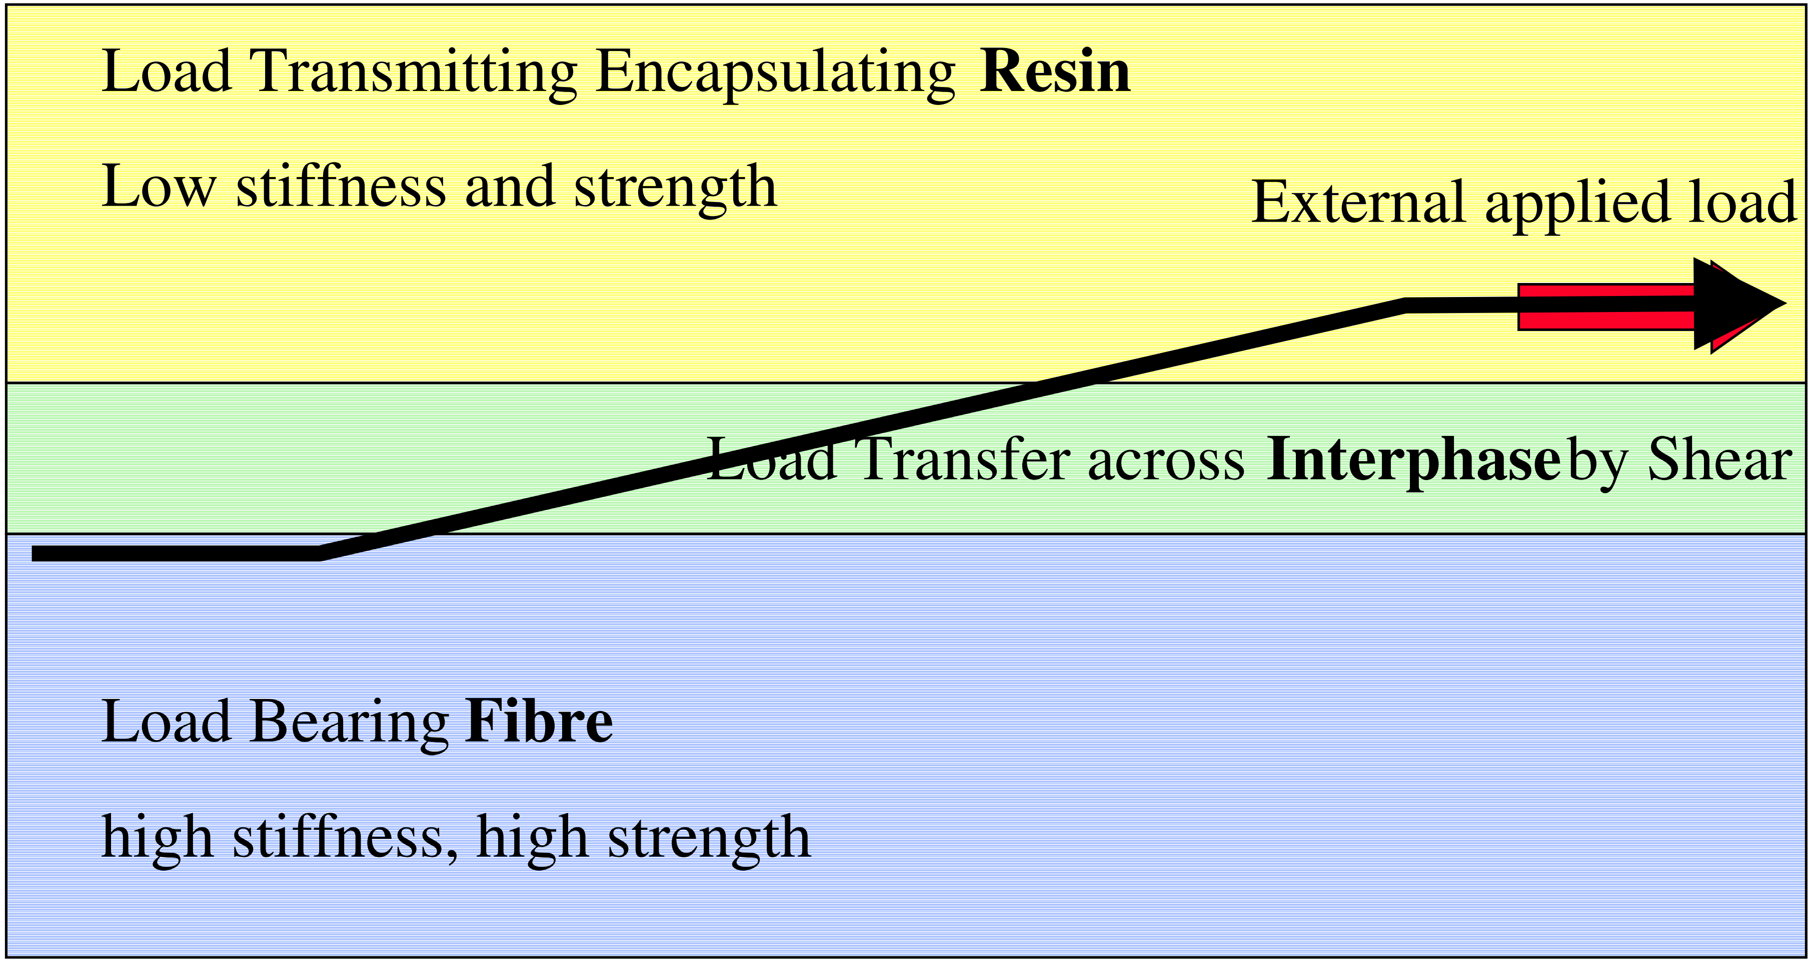
An example of how to get some support

How Does OC make (*more*) Money ???

University of Strathclyde

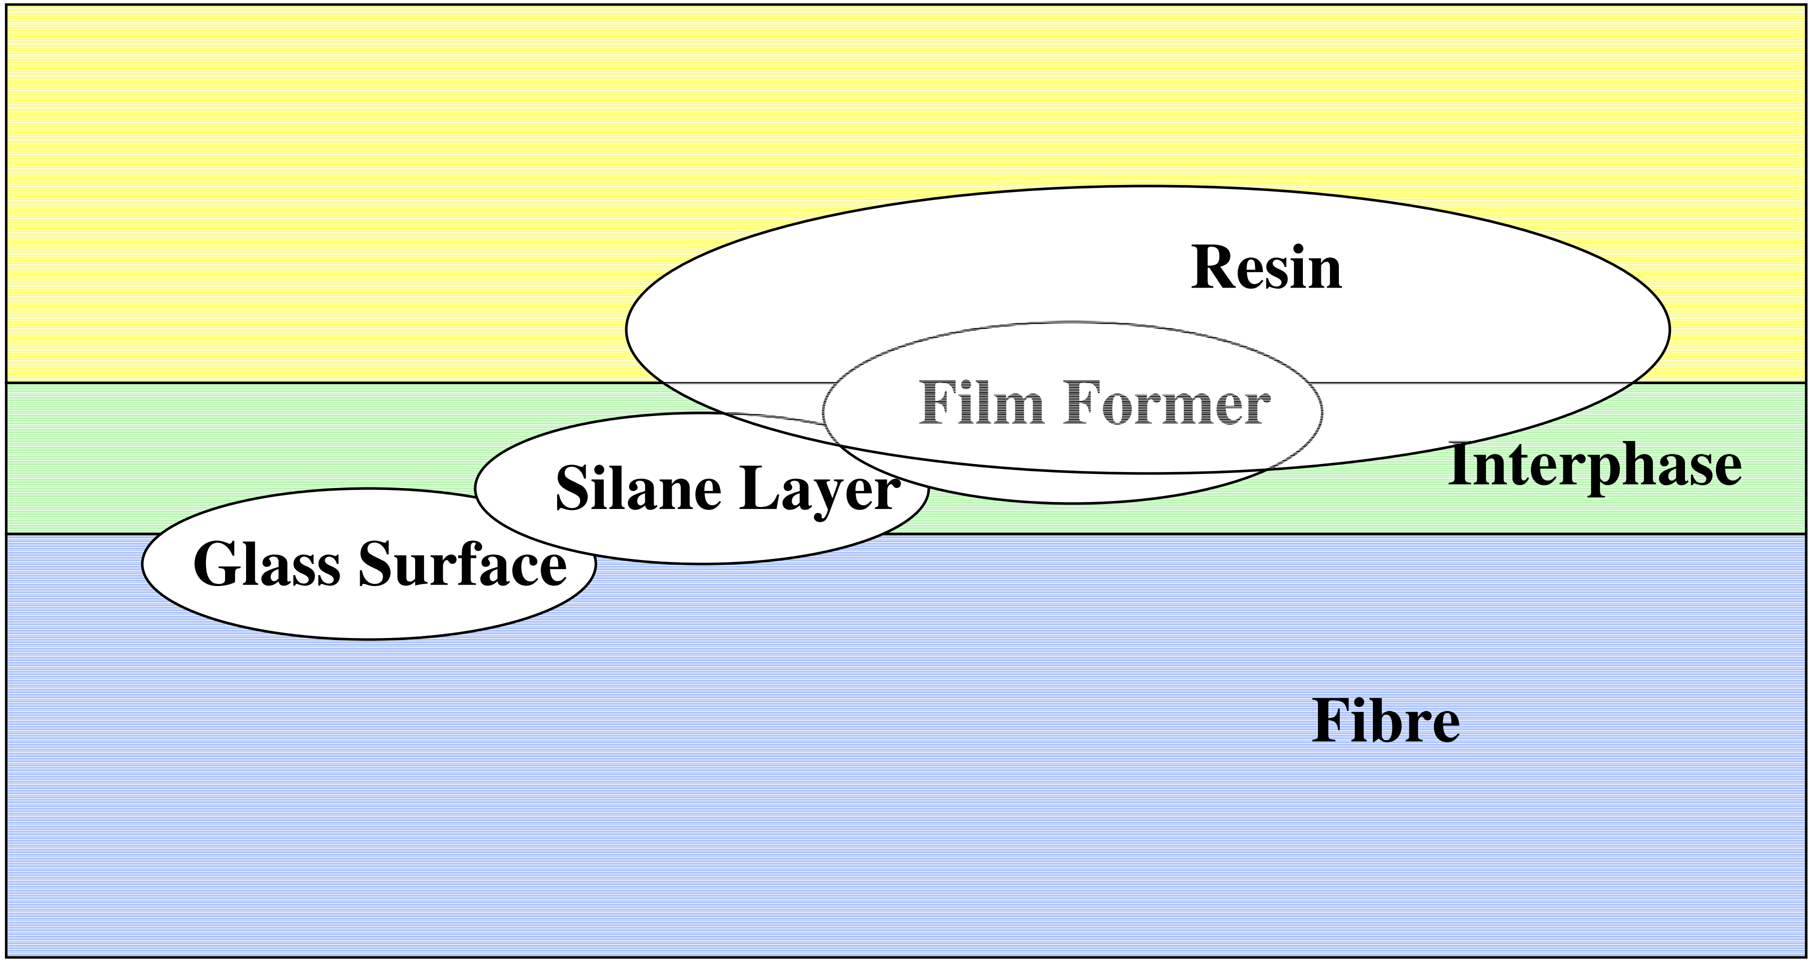
- You sell (*more*) reinforcements for composite materials
- So you need to produce good (*better*) reinforcement products
- So you need to understand (*better*) what reinforcements do (*for your customers*)
- So how does fibre reinforcement work ???

How does fibre reinforcement work ?



A "good" interphase is critical to nearly all composite performance criteria

What do we need to understand (better) ?



New Insights → New Product Innovations

The Results

University of Strathclyde

- **Were we successful ?**
  - **Owens Corning supports**
    - ***PhD Project 1 - X.Liu 10/2003-9/2006***
    - ***PhD Project 2 - C. Wang 10/2005-9/2008***
    - ***Post Doc Project - X. Liu 10/2006-9/2007***

Conclusions - What have we learned ?

- **Academia**
  - *Be flexible on IP*
  - *Plan for some changes in direction (in a 3 year project)*
  - *Clear unambiguous results (with confidence limits)*
- **Industry**
  - *Be flexible on publications*
  - *Ensure the research results will still be relevant in 3 years*
  - *Be (reasonably) patient*
- **Communication is key**
  - *Frequent*
  - *Appropriate Level of Detail*

The Challenge of New Product Development

- Results! Why, man, I have gotten a lot of results. I know several thousand things that won't work.
  - Thomas A. Edison (1847 - 1931)

- Industry can no longer afford to waste resources doing it this way

- Need better understanding and insights to guide more efficient product development programs with higher probability of success

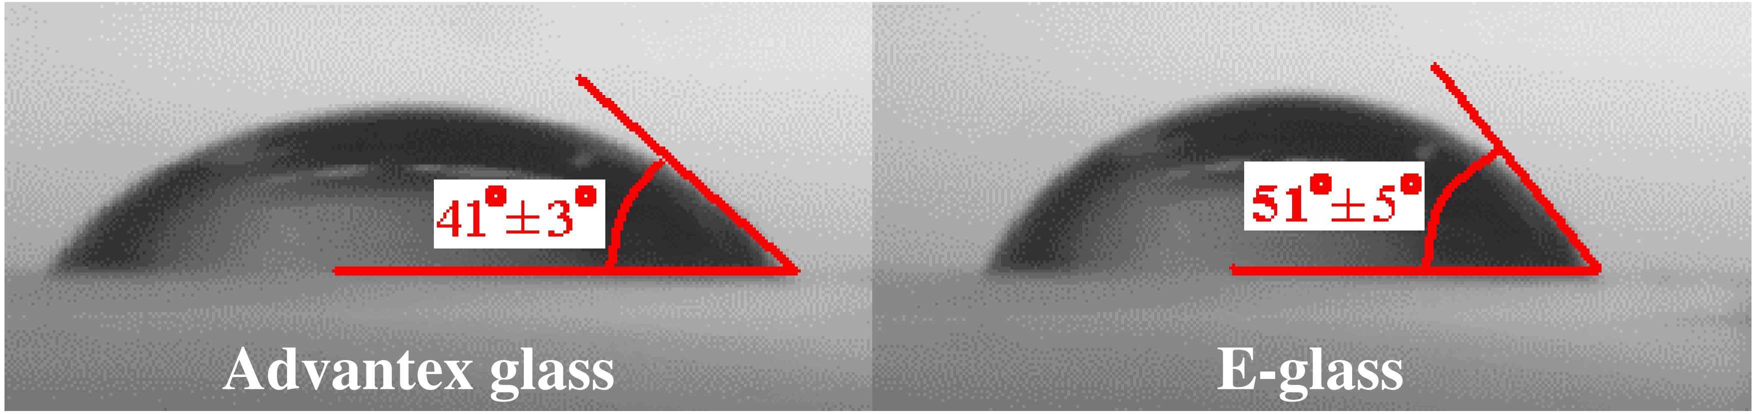
Contact Angle, water on glass slides



- Advantex is more hydrophilic than E-glass.
- Glass surface chemistry is different.
- Advantex surface had more polar (hydroxyl) groups than E-glass.

Why is this important ???

-OH groups are the principal sites for adsorption of, and reaction with, water and sizing molecules
