The health impact on children affected by parental imprisonment

Sarah Beresford, Nancy Loucks, Ben Raikes

INTRODUCTION

Scotland, England and Wales have the highest imprisonment rates in Western Europe. A number of studies have highlighted the devastating impact of parental imprisonment on children. As well as a significant sense of loss, many children experience stigma, social isolation, shame and fear. This underlines the need to use non-custodial measures wherever possible to reduce the disruption and trauma of a parent’s imprisonment. Parental imprisonment can have a negative impact on children’s short-term emotional well-being, as well as their long-term health and social prospects. Women, who are more likely to be primary carers, tend to receive short sentences for non-violent crimes without consideration of the impact on their children. Separation from a mother is particularly traumatic, and children affected often face greater disruption as it is more likely to involve other changes (eg, carer, home and school). Children with imprisoned mothers often reside with grandparents, who may also need practical and financial support.

Despite the adversities they face, children affected by imprisonment are rarely recognised as a distinct group within the systems and structures that should protect them, and no government agency is responsible for their well-being. While no systematic recording and monitoring system is in place, a 2019 report estimates that around 312,000 children are affected annually by parental imprisonment in England and Wales.

PARENTAL IMPRISONMENT IS AN ACE

The imprisonment of a household member is one of the ten adverse childhood experiences (ACEs) known to have a significant impact on long-term health and well-being. Further, the imprisonment of a household member is associated with a fivefold increase in exposure to other ACEs. The more ACEs a child suffers, the more likely this is to impact negatively on outcomes in terms of health, school attainment and later life experiences. Recent research has highlighted that those with a higher exposure to ACEs are more likely to go on to develop health-harming and antisocial behaviours, such as binge drinking, smoking and drug use. Poor health and social behaviour can lead to a more rapid development of diseases such as diabetes, cancer, cardiovascular disease and mental illness.

THE IMPACT ON HEALTH

A major pan-European study (COPING) investigated the mental health needs of children affected by parental imprisonment and children’s resilience and coping strategies. With an explicitly child-centred approach, the COPING study concluded that these children are at a significantly greater risk of suffering mental health difficulties than children who do not have parents in prison. Children with a parent in prison may experience low self-esteem, depression, disturbed sleeping patterns and symptoms of post-traumatic stress.

In a North American study, separation from a parent through imprisonment was found to be more detrimental to a child’s well-being than divorce or the death of a parent.

A significant number of UK children in the COPING study needed to access counselling or other kinds of support outside the family. However, while a range of services and interventions exist, these are not often targeted towards the needs of children of prisoners; services are patchy, uncoordinated and accessible by only a relatively small number of children. Many children of prisoners do not have enough support and often do not speak about what they have experienced, which may explain why they are more likely to experience mental health problems than other children.
An American study showed that children of incarcerated parents are a vulnerable population who experience disadvantages across an array of health outcomes, including learning disabilities, attention deficit disorder and attention deficit hyperactivity disorder, developmental delays, speech or language problems, as well as a higher rate of physical health conditions such as asthma and obesity. A recent Dutch study suggests a link between parental imprisonment and premature death.

**WHAT CAN HEALTH PROFESSIONALS DO?**

Families affected by imprisonment are often reluctant to access support from outside agencies. This may be due to shame and stigma, a lack of knowledge of what support is available, or a mistrust of statutory services. Health professionals who have an established relationship with families can be a gateway to further support and can ensure that staff are aware of, and trained in how to recognise and deal with, issues around imprisonment. Health professionals are well placed to build positive relationships actively with families affected by imprisonment and help carers to access additional forms of support. They can ensure families are aware of the full range of services available to them, including those that support families affected by substance misuse, domestic abuse, or physical or mental health problems, and can encourage family members to engage with other agencies in the community.

**SEEING THE POTENTIAL IN EVERY CHILD**

Some studies suggest that children of prisoners are more likely to end up in the criminal justice system as adults, or be involved in antisocial behaviour. What is crucial to understand, however, is that criminality is not an infection that can be passed on; rather it is the grief experienced by children, compounded by trauma, stigma, and practical implications such as loss of income or housing, which can lead to disengagement from school and a mistrust of authority. This in turn increases the potential to be involved in at-risk behaviour. In other words, it is not the imprisonment of the parent in and of itself, but the response to the imprisonment (social isolation and a sense of shame in addition to trauma) that increases the risk factor.

Primary health teams, with positive relationships with children and their families, can help children by seeing the potential they have, rather than the problems they face. As a YouTube video demonstrates, if children and young people are given a vision of hope, and feel that they have potential to change, it can make all the difference. Having a parent in prison is one of life’s most challenging experiences, but it does not have to define a child’s life. Primary healthcare professionals are key to helping each child realise their potential.

**Contributors**

All three authors of this editorial piece have extensive experience on research related to the impact of parental imprisonment on children and contributed to its content. The article was planned and submitted by SB, with significant contributions from NL and BR. NL performed the final editing of the article.

**Funding**

The authors have not declared a specific grant for this research from any funding agency in the public, commercial or not-for-profit sectors.

**Competing interests**

None declared.

**Patient consent for publication**

Not required.

**Provenance and peer review**

Commissioned; externally peer reviewed.
